

Dear Hiring Manager,

I am excited to apply for the Full Stack Engineer position, as my background in backend Java development and experience with large-scale systems align well with the requirements outlined in the job description. With my recent role as a Software Developer at Maximus, I have honed my skills in designing and implementing Java applications using Spring Boot, with a focus on microservice architectures suitable for mainframe environments. Furthermore, my experience in automating processes and managing build pipelines, gained as a Software Quality Engineer at Icon plc, has equipped me with a strong foundation in both development and testing practices.

I have a proven ability to analyze business requirements and translate them into functional applications, which is critical for effectively migrating systems to a service-oriented architecture. While my experience with Ruby is limited, my enthusiasm for learning and collaboration will support a smooth transition into the back-end migration tasks, particularly as they relate to fraud detection and risk management.

I am eager to contribute to your team by architecting reliable, efficient, and scalable solutions that enhance the performance and observability of systems. Thank you for considering my application. I look forward to the opportunity to discuss how my skills can contribute to your exciting projects.

Sincerely,

Andrew Kassab
